Sigmoid (logistic): Squashes input to (0, 1)
$f(x) = \frac{1}{1+e^{-x}}$
Output
Input
Hyperbolic Tangent (tanh): Squashes input to (-1, 1)
$f(x) = \tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$
Output
Input
Rectified Linear Unit (ReLU): Only keep positive values
$f(x) = \max(0, x)$
Output
Input
Step Function (Perceptron): Returns only -1 or 1
Output
Input
